COMPTIA SECURITY+ SY0-701 | DOMAIN 4 · SECURITY OPERATIONS (28%)

Security+ 4.2 · Asset Management

Mestre CyberSec · **Lesson 4.2 — Asset Management** (8:37) · Assistir Vídeo no YouTube ↗ · Treino Interativo: edusouzamarques.github.io/cybersec

Executive Lesson Summary: Gestão: procurement (compra padronizada); tracking (inventário, tag, DB); WORM (write once read many — imutável, anti-ransomware); media sanitization (wipe/degauss/destruição física antes de descartar).

💡 Key Exam Highlights & Critical Concepts

- WORM storage: escreve uma vez, nunca mais altera — imutável
- Media sanitization: wipe, degauss, shred físico

🎯 Exam Tips & Typical CompTIA Scenarios

- 'storage that cannot be modified after write'=WORM
- 'securely disposing of old hard drives'=media sanitization

🚨 Beyond the Video: Official Exam Concepts, Protocols & Traps (Section 4.2 — Asset Management)

Why is this advanced coverage required for SY0-701?: Video lectures provide foundational concepts, but CompTIA tests practical engineering judgment and requires deep familiarity with the following protocols, acronyms, and operational nuances in this domain:

• Asset Management (N/A)

Process of procuring, tracking, maintaining, and securely disposing of organizational assets throughout their lifecycle.

⚠️ ***Exam Trap:*** *Na prova, associe gestão de ativos a inventário, etiquetas, banco de dados e descarte seguro; não confunda com gestão de configuração.*

• Procurement (N/A)

Standardized process of purchasing hardware, software, and services to ensure approved, supported, and secure assets enter the organization.

⚠️ ***Exam Trap:*** *CompTIA destaca compra padronizada; se a questão mencionar evitar equipamentos não homologados ou padronizar fornecedores, é procurement.*

• Asset Tracking (N/A)

Maintaining an up-to-date inventory of assets using tags, databases, and ownership assignments to know what exists, where it is, and who owns it.

⚠️ ***Exam Trap:*** *Palavras-chave: inventário, tag, banco de dados, responsável. Diferente de WORM e sanitização.*

• WORM (Write Once Read Many)

Storage technology that allows data to be written once and read many times but prevents modification or deletion, protecting against ransomware and tampering.

⚠️ ***Exam Trap:*** *Gatilho: 'storage that cannot be modified after write' = WORM. Não confunda com RAID ou backup comum.*

• Media Sanitization (N/A)

Process of securely removing data from storage media before reuse, disposal, or transfer, using wiping, degaussing, or physical destruction.

⚠️ ***Exam Trap:*** *Gatilho: 'securely disposing of old hard drives' = media sanitization. Pode incluir wipe, degauss ou destruição física.*

• Wiping (N/A)

Software-based sanitization that overwrites storage media with zeros, ones, or random data to make previous data unrecoverable.

⚠️ ***Exam Trap:*** *Wipe é método lógico/software. Não é suficiente para mídia danificada; nesse caso, destruição física.*

• Degaussing (N/A)

Sanitization method that uses a strong magnetic field to erase data from magnetic media such as HDDs and tapes, often rendering the drive unusable.

⚠️ ***Exam Trap:*** *Degauss só funciona em mídia magnética (HDD/fita); não apaga SSD, pendrive ou mídia óptica.*

• Physical Destruction (N/A)

Sanitization method that shreds, incinerates, or otherwise destroys media so data cannot be recovered, often required for failed or high-security drives.

⚠️ ***Exam Trap:*** *Se a mídia está danificada ou o requisito é destruição total, escolha destruição física, não wipe/degauss.*

✅ Authentic Practice Questions (10 Real Exam Scenarios)

Scenario-based exam questions. Complete explanations and distractor analysis are provided in the answer key below.

QUESTION 1 · EXAM SCENARIO

A multinational company wants to reduce the risk of departments buying unsupported laptops, tablets, and network devices from local retailers. The security team recommends that all hardware purchases follow an approved catalog with preconfigured security baselines and vetted vendors. Which asset management practice is being implemented?

A) Standardized procurement

B) Asset tagging and inventory

C) WORM storage

D) Media sanitization

QUESTION 2 · EXAM SCENARIO

A hospital's security team must quickly locate every infusion pump, identify its department owner, and confirm its current firmware version during a vulnerability alert. Which capability should be implemented to meet this need?

A) An asset inventory integrated with unique tags, ownership records, and automated discovery

B) A WORM repository for pump logs

C) A media sanitization policy for pump storage

D) A standardized procurement catalog for medical devices

QUESTION 3 · EXAM SCENARIO

A financial services firm must retain audit logs for seven years. Regulators require that the logs cannot be altered or deleted, even by a compromised administrator or ransomware. Which storage control should be used?

A) RAID 6 array with hourly snapshots

B) Write once read many storage

C) Full-disk encryption with key escrow

D) SIEM correlation rules

QUESTION 4 · EXAM SCENARIO

An IT team plans to reuse solid-state drives that previously stored customer data in a lower-security test lab. The drives support built-in sanitization commands. Which method is most appropriate before reuse?

A) Degaussing the drives

B) Deleting all partitions and formatting

C) Performing a cryptographic erase or secure erase

D) Shredding the drives

QUESTION 5 · EXAM SCENARIO

A company is retiring magnetic hard drives that are physically damaged and cannot be powered on. The data is highly sensitive. Which disposal method best ensures data cannot be recovered?

A) Standard overwrite with a software wiping tool

B) Degaussing and then returning to the vendor

C) Physical destruction by shredding or incineration

D) Deleting the drive volumes and resetting the controller

QUESTION 6 · EXAM SCENARIO

During incident response, an analyst discovers an unapproved server on the corporate network. The analyst needs to determine who requested it, which business unit owns it, and whether it completed security review. Which asset management component would provide this information?

A) A configuration management database with ownership and approval records

B) A WORM archive of security logs

C) A media sanitization log

D) A procurement discount agreement

QUESTION 7 · EXAM SCENARIO

Employees at a software company often use corporate credit cards to subscribe to cloud productivity tools without involving IT or security. This creates unsupported data storage and compliance risk. Which control should be implemented first to address the root cause?

A) A centralized procurement approval process with security review for cloud services

B) An asset tag for every cloud subscription

C) A WORM policy for cloud storage

D) A quarterly degaussing schedule

QUESTION 8 · EXAM SCENARIO

An organization tracks thousands of laptops with three-year warranties and software support contracts. The IT director wants automatic alerts 60 days before warranty or support expiration. Which asset management practice is required?

A) Media sanitization tracking

B) Lifecycle tracking in the asset database

C) WORM storage for warranty documents

D) Physical destruction scheduling

QUESTION 9 · EXAM SCENARIO

A legal department requires that certain email records remain unchanged and readable for an active litigation hold. Administrators must not be able to modify or delete the records until the hold is lifted. Which data storage feature best satisfies this requirement?

A) Deduplication with compression

B) Immutability using write once read many storage

C) Journaling file system

D) Volume snapshots taken hourly

QUESTION 10 · EXAM SCENARIO

An organization is discarding USB flash drives that contained sensitive human resources data. The drives will not be reused. Which sanitization method is most appropriate to prevent data recovery?

A) Degaussing each drive

B) Quick formatting each drive

C) Physical destruction of each drive

D) Overwriting each drive with a single pass and returning it to inventory

ANSWER KEY & COMPREHENSIVE DISTRACTOR EXPLANATIONS

Question 1: Option A — Standardized procurement

Standardized procurement centralizes purchasing through approved vendors and configurations, reducing unsupported or noncompliant assets. Asset tracking would record devices after purchase but would not prevent unsupported purchases. WORM and media sanitization address data immutability and disposal, not procurement.

Question 2: Option A — An asset inventory integrated with unique tags, ownership records, and automated discovery

An asset inventory with unique tags, ownership data, and automated discovery provides the location, responsible department, and firmware details needed for rapid response. WORM storage protects logs from alteration but does not identify pump ownership. Media sanitization and procurement catalogs do not provide real-time asset visibility.

Question 3: Option B — Write once read many storage

Write once read many storage enforces immutability, preventing modification or deletion during the retention period, which directly satisfies the regulatory requirement. RAID and snapshots improve availability and recovery but can still be altered or deleted. Encryption and SIEM rules do not provide immutable retention.

Question 4: Option C — Performing a cryptographic erase or secure erase

Solid-state drives should be sanitized using built-in secure erase or cryptographic erase commands because degaussing does not affect flash memory and simple deletion or formatting leaves recoverable data. Physical shredding prevents reuse, which is unnecessary if the drives will be reused.

Question 5: Option C — Physical destruction by shredding or incineration

When magnetic drives are damaged and cannot be wiped logically, physical destruction by shredding or incineration provides the strongest assurance that data cannot be recovered. Software overwriting requires a working drive, degaussing may be insufficient for damaged media, and deleting volumes does not securely erase data.

Question 6: Option A — A configuration management database with ownership and approval records

A configuration management database or asset inventory with ownership and approval records enables analysts to identify the requester, business owner, and security review status of a discovered asset. WORM archives and sanitization logs protect or document data disposal, while a discount agreement does not track asset ownership or approval.

Question 7: Option A — A centralized procurement approval process with security review for cloud services

A centralized procurement approval process with security review controls the root cause by requiring cloud services to be vetted and approved before purchase. Asset tagging, WORM policies, and degaussing are useful for tracking, immutability, and disposal, but they do not prevent unapproved cloud subscriptions from being purchased.

Question 8: Option B — Lifecycle tracking in the asset database

Lifecycle tracking in the asset database records warranty, support, and expiration dates and can generate alerts before coverage ends. Media sanitization tracking, WORM storage, and destruction scheduling do not provide proactive warranty or support expiration notifications.

Question 9: Option B — Immutability using write once read many storage

Write once read many storage provides immutability, ensuring records remain unchanged and readable for the litigation hold period and cannot be modified or deleted by administrators. Deduplication, journaling, and snapshots support efficiency or recovery but do not enforce legal immutability.

Question 10: Option C — Physical destruction of each drive

Physical destruction is the most appropriate method for flash media that will not be reused because it prevents any possibility of data recovery. Degaussing does not affect flash memory, quick formatting leaves data recoverable, and overwriting is unnecessary if the drives are being destroyed.
